

# COMP284 Scripting Languages

## Lecture 2: Perl (Part 1) Handouts (8 on 1)

Ullrich Hustadt

Department of Computer Science  
School of Electrical Engineering, Electronics, and Computer Science  
University of Liverpool

Perl: Overview

Applications

## Perl: Applications

- Applications written in Perl
  - **Movable Type** – web publishing platform  
<http://www.movabletype.org/>
  - **Request Tracker** – issue tracking system  
<http://bestpractical.com/rt/>
  - **Slash** – database-driven web application server  
<http://sourceforge.net/projects/slashcode/>

COMP284 Scripting Languages

Lecture 2

Slide L2 – 4

## Contents

- 1 Perl: Overview
  - History
  - Applications
  - Java vs Perl
- 2 Scalars
  - Definition
  - Integers and Floating-point numbers
  - Strings
  - 'Booleans'
  - Comparisons
- 3 Variables, Constants, and Assignments
  - Variables
  - Constants
  - Assignments
  - Variable interpolation

COMP284 Scripting Languages

Lecture 2

Slide L2 – 3

Perl: Overview

Applications

## Perl: Applications

- Organisations using Perl
  - **Amazon** – online retailer  
<http://www.amazon.co.uk>
  - **BBC** – TV/Radio/Online entertainment and journalism  
<http://www.bbc.co.uk>
  - **Booking.com** – hotel bookings  
<http://www.booking.com>
  - **craigslist** – classified ads  
<http://www.craigslist.org>
  - **IMDb** – movie database  
<http://www.imdb.com>
  - **Monsanto** – agriculture/food/culture  
<http://www.monsanto.co.uk/>
  - **Slashdot** – technology related news  
<http://slashdot.org>

COMP284 Scripting Languages

Lecture 2

Slide L2 – 5

Perl: Overview

History

## Perl

- Originally developed by **Larry Wall** in 1987  
Perl 6 was released in December 2015
- Borrows features from
  - **C**  
imperative language with variables, expressions, assignment statements, blocks of statements, control structures, and procedures / functions
  - **Lisp**  
lists, list operations, functions as first-class citizens
  - **AWK** (pattern scanning and processing language)  
hashes / associative arrays, regular expressions
  - **sed** (stream editor for filtering and transforming text)  
regular expressions and substitution s///
  - **Shell**  
use of **sigils** to indicate **type** (\$ – scalar, @ – array, % – hash, & – procedure)
  - **Object-oriented programming languages**  
classes/packages, inheritance, methods

COMP284 Scripting Languages

Lecture 2

Slide L2 – 2

Perl: Overview

Java vs Perl

## Java versus Perl: Java

```
/* Author: Clon D. ...  
 * The HelloWorld class implements an application  
 * that prints out "Hello World".  
 */  
5 public class HelloWorld {  
6     // -----METHODS-----  
7     /* Main Method */  
8     public static void main(String[] args) {  
9         System.out.println("Hello World");  
10    }  
11 }
```

Edit-compile-run cycle:

- 1 Edit and save as HelloWorld.java
- 2 Compile using javac HelloWorld.java
- 3 Run using java HelloWorld

COMP284 Scripting Languages

Lecture 2

Slide L2 – 6

Perl: Overview

Applications

## Perl: Uses and applications

- Main application areas of Perl
  - **text processing**  
~ easier and more powerful than sed or awk
  - **system administration**  
~ easier and more powerful than shell scripts
- Other application areas
  - web programming
  - code generation
  - bioinformatics
  - linguistics
  - testing and quality assurance

COMP284 Scripting Languages

Lecture 2

Slide L2 – 3

Perl: Overview

Java vs Perl

## Java versus Perl: Perl

```
1 #!/usr/bin/perl  
2 # Author: Ullrich Hustadt  
3 # The HelloWorld script implements an application  
4 # that prints out "Hello World".  
5  
6 print "Hello World\n";
```

Edit-run cycle:

- 1 Edit and save as HelloWorld
- 2 Run using perl HelloWorld

- 
- 1 Edit and save as HelloWorld
  - 2 Make it executable  
chmod u+x HelloWorld  
This only needs to be done once!
  - 3 Run using ./HelloWorld

Scalars

Strings

Strings

Perl distinguishes between

- single-quoted strings and
- double-quoted strings

single-quoted strings (‘taken literally’)	double-quoted strings (‘interpreted’/‘evaluated’)
<code>'hello'</code> ~ hello	<code>"hello"</code> ~ hello
<code>'don't'</code> ~ don't	<code>"don't"</code> ~ don't
<code>'"hello"'</code> ~ "hello"	<code>"\"hello\""</code> ~ "hello"
<code>'backslash\\'</code> ~ backslash\	<code>"backslash\\"</code> ~ backslash\
<code>'glass\\table'</code> ~ glass\table	<code>"glass\\table"</code> ~ glass\table
<code>'glass\table'</code> ~ glass\table	<code>"glass\table"</code> ~ glass\table

In Java, [single quotes](#) are used for single characters and [double quotes](#) for strings

COMP284 Scripting LanguagesLecture 2Slide L2 – 16

Scalars

Strings

String operators and automatic conversion

- Two basic operations on strings are
  - string concatenation
    - `"hello" . "world"` ~ "helloworld"
    - `"hello" . 'world'` ~ "helloworld"
    - `"\Uhello" . ' \LWORLD'` ~ 'HELLO\LWORLD'
  - string repetition x:
    - `"hello_" x 3` ~ "hello\_hello\_hello\_"
- These operations can be combined
  - `"hello_" . "world_" x 2` ~ "hello\_world\_world\_"
- Perl automatically converts between strings and numbers
  - `2 . "_worlds"` ~ "2\_worlds"
  - `"2" * 3` ~ 6
  - `2e-1 x 3` ~ "0.20.20.2" ("0.2" repeated three times)
  - `"hello" * 3` ~ 0

COMP284 Scripting LanguagesLecture 2Slide L2 – 20

Scalars

Strings

Double-quoted string backslash escapes

- In a single-quoted string `\t` is simply a string consisting of `\` and `t`
- In a double-quoted string `\t` and other [backslash escapes](#) have the following meaning

Construct	Meaning
<code>\n</code>	Logical Newline (actual character is platform dependent)
<code>\f</code>	Formfeed
<code>\r</code>	Return
<code>\t</code>	Tab
<code>\l</code>	Lower case next letter
<code>\L</code>	Lower case all following letters until <code>\E</code>
<code>\u</code>	Upper case next letter
<code>\U</code>	Upper case all following letters until <code>\E</code>
<code>\Q</code>	Quote non-word characters by adding a backslash until <code>\E</code>
<code>\E</code>	End <code>\L</code> , <code>\U</code> , <code>\Q</code>

COMP284 Scripting LanguagesLecture 2Slide L2 – 17

Scalars

'Booleans'

'Booleans'

- Unlike Java, Perl does **not** have a [boolean datatype](#)
- Instead the values
  - `0` # zero
  - `''` # empty string
  - `'0'` # string consisting of zero
  - `undef` # undefined
  - `()` # empty list

all represent [false](#) while all other values represent [true](#)

COMP284 Scripting LanguagesLecture 2Slide L2 – 21

Scalars

Strings

UTF-8

- Perl supports [UTF-8](#) character encodings which give you access to non-ASCII characters
- The pragma
  - `use utf8;`
  - allows you to use UTF-8 encoded characters in Perl scripts
- The function call
  - `binmode(STDIN, ":encoding(UTF-8)");`
  - `binmode(STDOUT, ":encoding(UTF-8)");`
  - ensures that UTF-8 characters are read correctly from STDIN and printed correctly to STDOUT
- The `Unicode::Normalize` module enables correct [decomposition](#) of strings containing UTF-8 encoded characters
  - `use Unicode::Normalize;`

COMP284 Scripting LanguagesLecture 2Slide L2 – 18

Scalars

'Booleans'

'Boolean operators'

Perl offers the same [short-circuit boolean operators](#) as Java: `&&`, `||`, `!`

Alternatively, `and`, `or`, `not` can be used

A	B	(A && B)
true	true	B (true)
true	false	B (false)
false	true	A (false)
false	false	A (false)

A	(! A)
true	'' (false)
false	1 (true)

A	B	(A    B)
true	true	A (true)
true	false	A (true)
false	true	B (true)
false	false	B (false)

- Note that this means that `&&` and `||` are **not commutative**, that is, `(A && B)` is not the same as `(B && A)`

```
($denom != 0) && ($num / $denom > 10)
```

COMP284 Scripting LanguagesLecture 2Slide L2 – 22

Scalars

Strings

UTF-8

Example:

```
binmode(STDOUT, ":utf8");
print "\x{4f60}\x{597d}\x{4e16}\x{754c}\n"; # chinese
print "\x{062d}\x{f0}\n"; # arabic
```

For further details see Schwartz et al., Appendix C

COMP284 Scripting LanguagesLecture 2Slide L2 – 19

Scalars

Comparisons

Comparison operators

Perl distinguishes between [numeric comparison](#) and [string comparison](#)

Comparison	Numeric	String
Equal	<code>==</code>	<code>eq</code>
Not equal	<code>!=</code>	<code>ne</code>
Less than	<code>&lt;</code>	<code>lt</code>
Greater than	<code>&gt;</code>	<code>gt</code>
Less than or equal to	<code>&lt;=</code>	<code>le</code>
Greater than or equal to	<code>&gt;=</code>	<code>ge</code>

Examples

```
35 == 35.0 # true
'35' eq '35.0' # false
'35' == '35.0' # true
35 < 35.0 # false
'35' lt '35.0' # true
'ABC' eq "\Uabc" # true
```

COMP284 Scripting LanguagesLecture 2Slide L2 – 23

Variables, Constants, and Assignments

Variables

Scalar variables

- Scalar variables start with \$ followed by a Perl identifier
- A Perl identifier consists of letters, digits, and underscores, but cannot start with a digit  
Perl identifiers are case sensitive
- In Perl, a variable does not have to be declared before it can be used
- Scalar variables can store any scalar value (there are no 'integer variables' versus 'string variables')

COMP284 Scripting LanguagesLecture 2Slide L2 – 24

Variables, Constants, and Assignments

Assignments

Assignments

- Just like Java, Perl uses the equality sign = for assignments:

```
$student_id = 200846369;
$name = "Jan_Olsen";
$student_id = "E00481370";
```

But no type declaration is required and the same variable can hold a number at one point and a string at another
- An assignment also returns a value, namely (the final value of) the variable on the left  
~ enables us to use an assignment as an expressions

Example:

```
$b = ($a = 0) + 1;
# $a has value 0
# $b has value 1
```

COMP284 Scripting LanguagesLecture 2Slide L2 – 28

Variables, Constants, and Assignments

Variables

Scalar variables

- A variable also does not have to be initialised before it can be used, although initialisation is a good idea
- Uninitialised variables have the special value undef  
However, undef acts like 0 for numeric variables and like '' for string variables if an uninitialised variable is used in an arithmetic or string operation
- To test whether a variable has value undef use the routine defined

```
$s1 = "";
print '$s1 eq undef: ', ($s1 eq undef) ? 'TRUE' : 'FALSE', "\n";
print '$s1 defined: ', (defined $s1) ? 'TRUE' : 'FALSE', "\n";
print '$s2 defined: ', (defined $s2) ? 'TRUE' : 'FALSE', "\n";

$s1 eq undef: TRUE
$s1 defined: TRUE
$s2 defined: FALSE
```

COMP284 Scripting LanguagesLecture 2Slide L2 – 25

Variables, Constants, and Assignments

Assignments

Binary assignments

There are also binary assignment operators that serve as shortcuts for arithmetic and string operations

Binary assignment	Equivalent assignment
\$a += \$b	\$a = \$a + \$b
\$a -= \$b	\$a = \$a - \$b
\$a *= \$b	\$a = \$a * \$b
\$a /= \$b	\$a = \$a / \$b
\$a %= \$b	\$a = \$a % \$b
\$a **= \$b	\$a = \$a ** \$b
\$a .= \$b	\$a = \$a . \$b

Example:

```
# Convert Fahrenheit to Celsius:
# Subtract 32, then multiply by 5, then divide by 9
$temperature = 105; # temperature in Fahrenheit
($temperature -= 32) *= 5/9; # converted to Celsius
```

COMP284 Scripting LanguagesLecture 2Slide L2 – 29

Variables, Constants, and Assignments

Variables

Special Variables

- Perl has a lot of 'pre-defined' variables that have a particular meaning and serve a particular purpose

Variable	Explanation
\$_	The default or implicit variable
@_	Subroutine parameters
\$a, \$b	sort comparison routine variables
\$_	the string matched by the last successful pattern match
\$/	input record separator, newline by default
\$\	output record separator, undef by default
\$]	version of Perl used

- For a full list see <https://perldoc.perl.org/perlvar.html#SPECIAL-VARIABLES>

COMP284 Scripting LanguagesLecture 2Slide L2 – 26

Variables, Constants, and Assignments

Assignments

Variable declarations

- In Perl, variables can be declared using the my function (Remember, this is not a requirement)
- The pragma  
use strict;  
enforces that all variables must be declared before their use, otherwise a compile time error is raised

Example:

```
use strict;
$studentsOnCOMP284 = 133;

Global symbol "$studentOnCOMP284" requires explicit
package name at ./script line 2.
Execution of ./script aborted due to compilation errors.

use strict;
my $studentsOnCOMP281;
$studentsOnCOMP281 = 154;
my $studentsOnCOMP283 = 53;
```

COMP284 Scripting LanguagesLecture 2Slide L2 – 30

Variables, Constants, and Assignments

Constants

Constants

Perl offers three different ways to declare constants

- Using the constant pragma:

```
use constant PI => 3.14159265359;
```

(A pragma is a module which influences some aspect of the compile time or run time behaviour of Perl)
- Using the Readonly module:

```
use Readonly;
Readonly $PI => 3.14159265359;
```
- Using the Const::Fast module:

```
use Const::Fast;
const $PI => 3.14159265359;
```

With our current Perl installation only constant works  
~ variable interpolation with constants does not work

COMP284 Scripting LanguagesLecture 2Slide L2 – 27

Variables, Constants, and Assignments

Variable interpolation

Variable interpolation

Variable interpolation

Any scalar variable name in a double quoted string is (automatically) replaced by its current value

Example:

```
$actor = "Jeff_Bridges";
$prize = "Academy_Award_for_Best_Actor";
$year = 2010;
print "1: ", $actor, " won the ", $prize, " in ", $year, "\n";
print "2: $actor won the $prize in $year\n";
```

Output:

```
1: Jeff Bridges won the Academy Award for Best Actor in 2010
2: Jeff Bridges won the Academy Award for Best Actor in 2010
```

COMP284 Scripting LanguagesLecture 2Slide L2 – 31
